Dear Hiring Manager,

I'm excited to apply for the AI Developer position at Software International. With over five years of experience in software engineering, particularly in AI and autonomous systems, I'm well-prepared to contribute to developing cutting-edge agentic applications. At Amazon, I led a team to create AI-driven documentation solutions that decreased question resolution time by 82%, translating to significant productivity gains for our development teams. This experience aligns perfectly with your need for someone who can integrate autonomous agents into workflows effectively.

My role at T4G Limited involved architecting NLP chatbots that secured contracts worth over $100K. This experience honed my skills in designing APIs and building resilient applications, which I understand is vital for the role at Software International. I'm proficient in both statically typed languages like C# and scripting languages such as Python, ensuring I can adapt quickly to your technology stack. I also have hands-on experience with cloud platforms, having utilized AWS services to optimize CI/CD pipelines, achieving a remarkable 90% reduction in manual reporting time.

What truly excites me about this opportunity is the chance to shape how agentic applications are built and deployed in real-world environments. I'm eager to contribute my knowledge of best practices for deploying autonomous agents, as well as my passion for continuous learning in AI technologies, to ensure the applications we build are not just efficient but also ethical and reliable. I look forward to potentially being a part of a team that values experimentation and quality engineering as much as I do.

Sincerely,
Aviral Garg
